Mitchell McCarvel

U.S. Chronic Disease Data & Representation

Key Questions Being Addressed:

- What are the most studied diseases in the U.S.?

- Does U.S. disease research accurately represent its prevalence in each ethnic group?

- How does disease data collection vary by state?

Insights:

- COPD, cardiovascular disease, and cancer are the 3 most dominantly displayed chronic diseases in the datasets.

- White patients contain the most amount of data across all disease categories in the datasets, indicating uneven representation in U.S. chronic disease data collection.

- Research collection by U.S. state is typically proportional with the state's population.

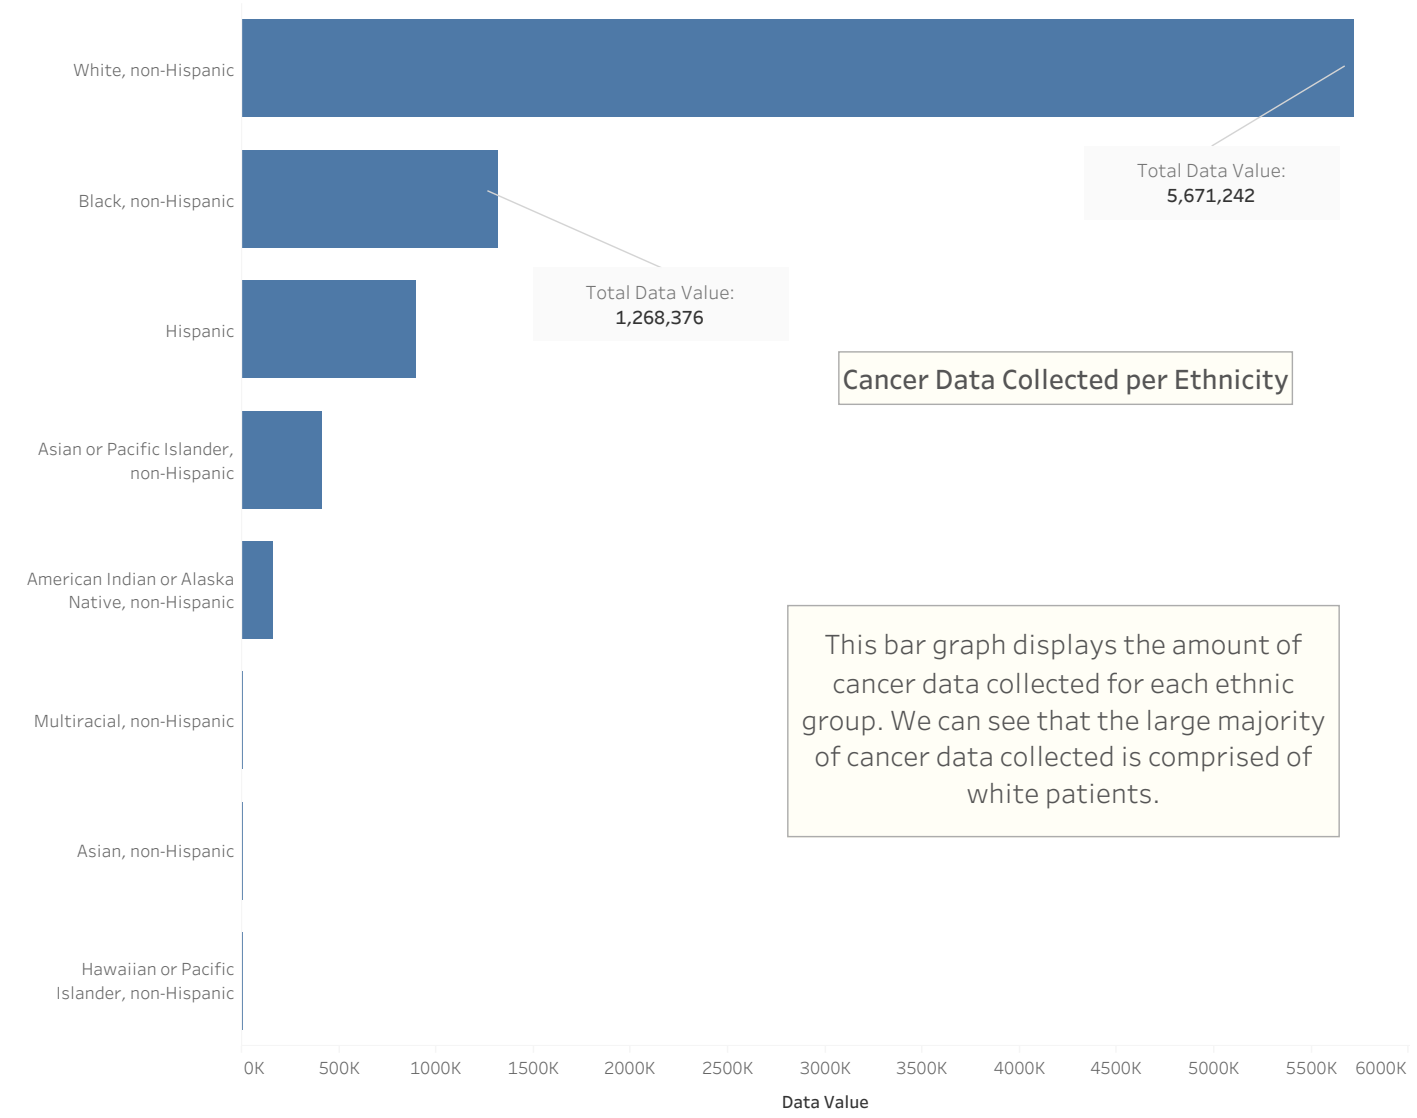
Top 5 U.S. Chronic Diseases

This interactive Top K chart displays the U.S. chronic diseases with the most data collected. The top 3 are COPD, cardiovascular disease, and cancer.

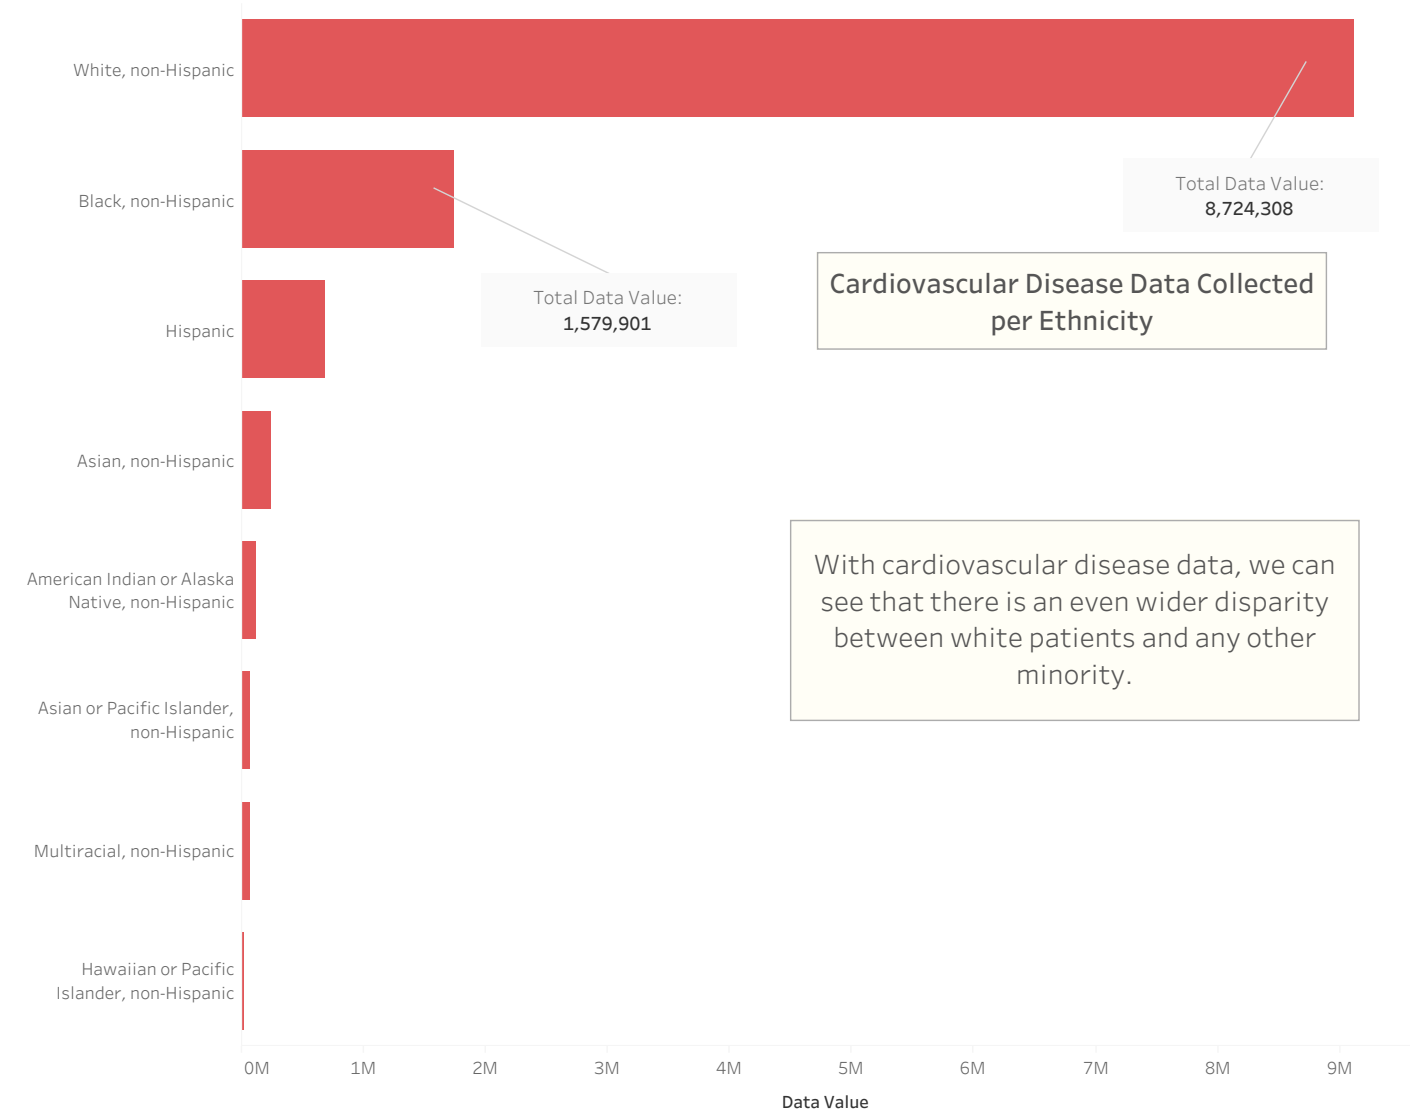
U.S. Chronic Disease Data & Representation



Cancer Data Collected per Ethnicity

This bar graph displays the amount of cancer data collected for each ethnic group. We can see that the large majority of cancer data collected is comprised of white patients.

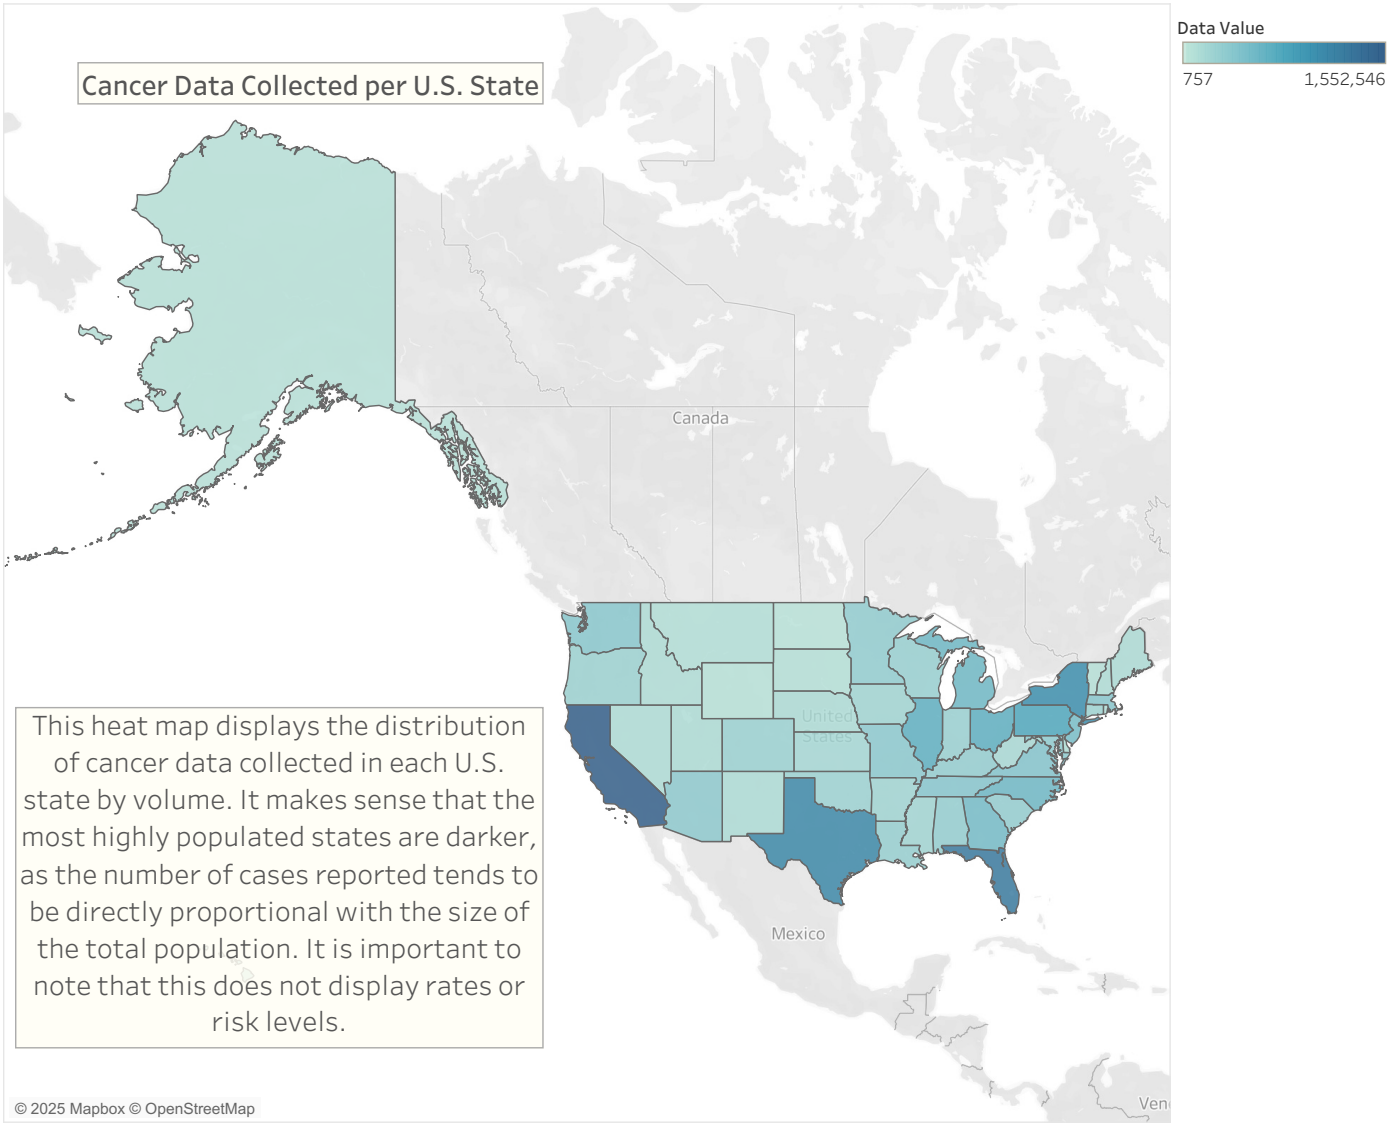
U.S. Chronic Disease Data & Representation



Cardiovascular Disease Data Collected per Ethnicity

With cardiovascular disease data, we can see that there is an even wider disparity between white patients and any other minority.

U.S. Chronic Disease Data & Representation



This heat map displays the distribution of cancer data collected in each U.S. state by volume. It makes sense that the most highly populated states are darker, as the number of cases reported tends to be directly proportional with the size of the total population. It is important to note that this does not display rates or risk levels.
